Contents

- **What is Fuzzy Logic**
- **Fuzzy Logic in Image Processing**
- **Medical Imaging Applications**
- **Fuzzy Logic in Medical Imaging**
- **Neuro-Fuzzy Systems**

Introduction of Fuzzy Logic

- Fuzzy Logic was initiated in 1965 by Professor Lotfi Zadeh.
- It is basically a multi-valued logic that allows intermediate values to be defined between conventional boolean logic like true/false, yes/no, black/white.
- Human-like way of thinking e.g. warm, hot, very hot.

Boolean Logic		Fuzzy Logic	
IF	TRUE FALSE	IF	TRUE FALSE
AND/OR	TRUE FALSE	AND/OR	TRUE FALSE
THEN	TRUE FALSE	THEN	TRUE FALSE

Fuzzy Predicates

- **Expensive**
- **Safe**
- **Old**
- **Rare**
- **Dangerous**
- **Educated**
- **Tall**
- **Heavy**
- **Smooth**
- **Rough**
- **Beautiful**

Fuzzy Quantifiers

- **Many**
- **Few**
- **Almost**
- **All**
- **Usually**
- **Almost nobody**
- **Almost everybody**

Fuzzy Truth Values

- **Extremely True**
- **Quite True**
- **Very True**
- **Almost True**
- **More or less True**
- **Mostly True**
- **Mostly False**
- **More or less False**
- **Almost False**
- **Quite False**
- **Very False**
- **Quite False**
- **Extremely False**

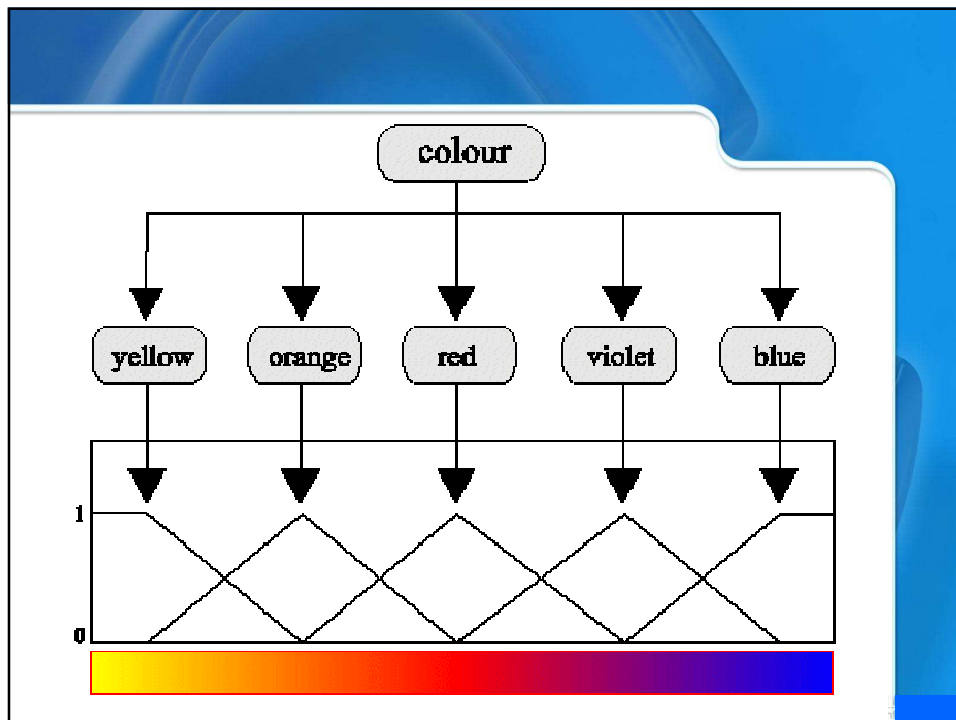

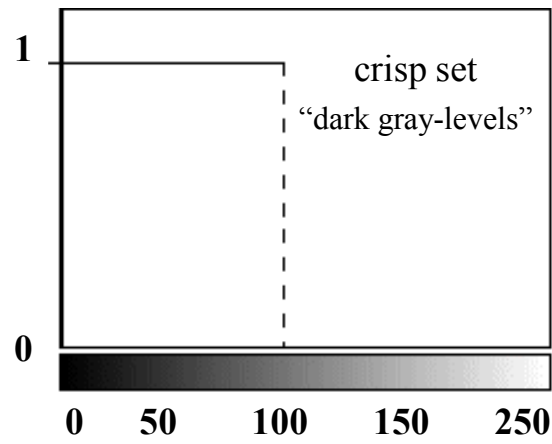

Fuzzy Modifiers

- **Likely**
- **Extremely Unlikely**
- **Almost Impossible**

Fuzzy Relational Operators

- **Equal**
- **Slightly greater than**
- **Much greater than**
- **Much less than**

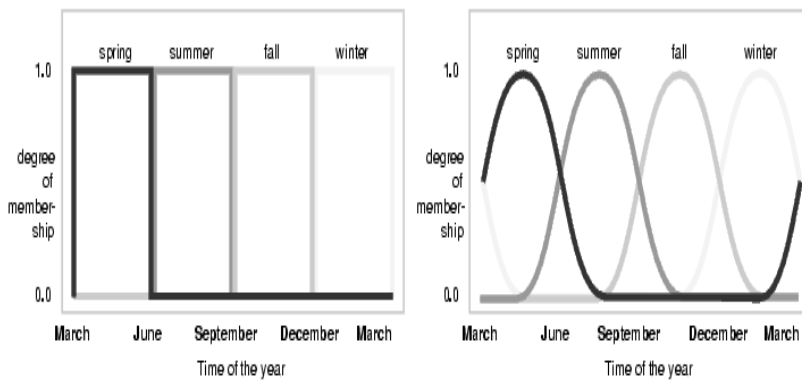

Gray Level Crisp and Fuzzy

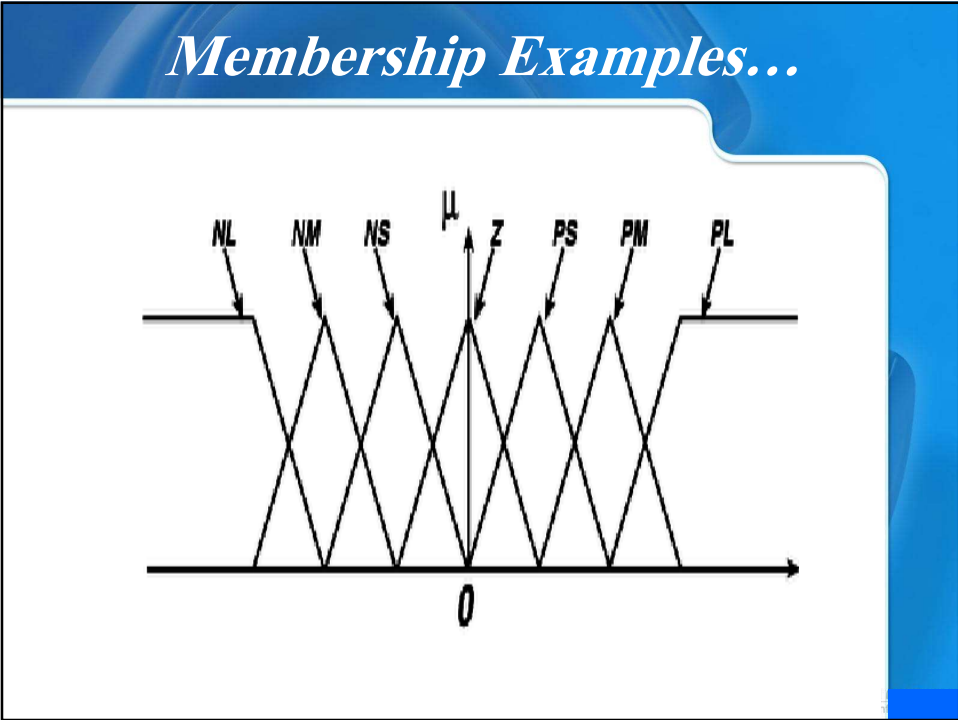

Membership of Young age

Membership Examples...

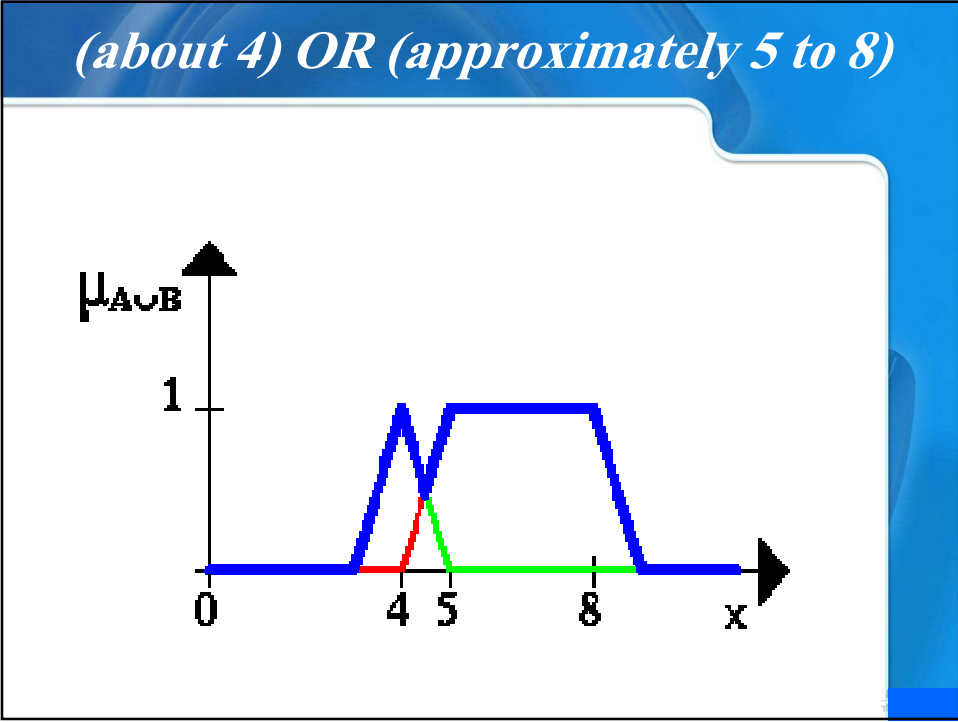

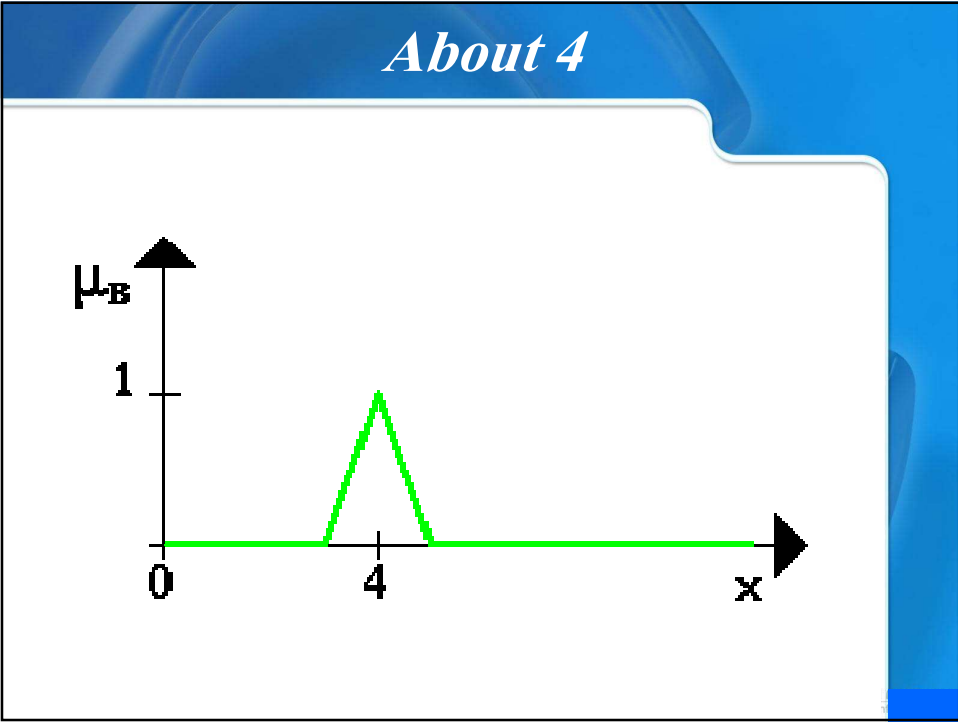

The sets more or less old, very young are derived from young

Membership (approximately Five to Eight)

(approximately 5 to 8) and not (approximately 5 to 8)

(about 4) AND (approximately 4 to 8)

Boolean Logic

Here 26.9 and 27.1 belong to two different sets

Fuzzy Logic

Here 26.9 and 27.1 belong to the same sets to approximately the same degree

The three primitive set operations.

Degree of Membership

Membership Functions

Rule Based System Architectures

- Rules: **IF : Condition-i and Condition-2 and Condition-3**
Then : **Take Action-4**

Examples:

- IF **Temperature > 32C**, and **Outlet-pressure-of-the-gases > 10 Atmosphere** and **valve-i is closed** THEN **open valve-2**
- IF **The shunt-field-current < 0.01 A** and **Armature-current > 20A** Then **shut-down-the-Supply**
- IF **Resistance-i is hot** and **Voltage-2 < 6V** Then **Capacitor-2 is faulty** Because **Capacitor-2 fault causes excessive current through Resistance-i**

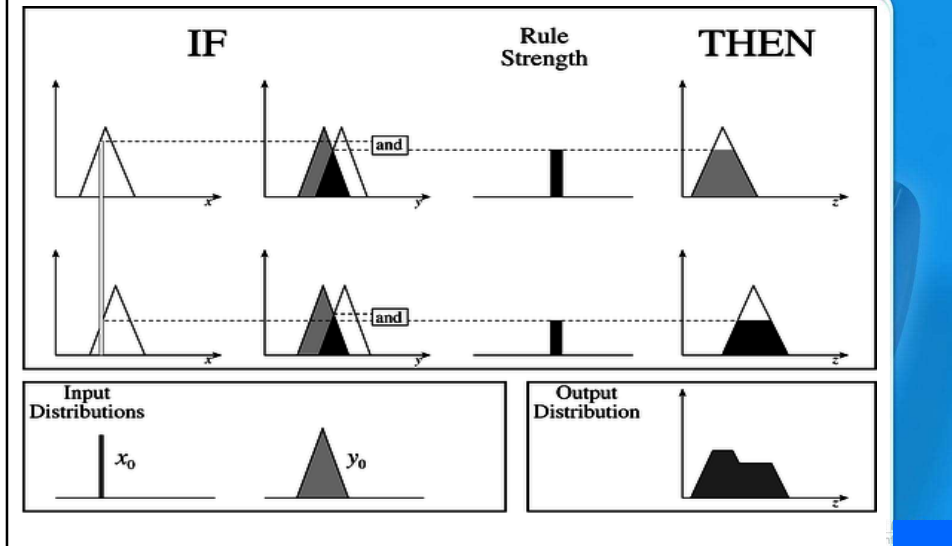

(i) Create Rule Base

- Fuzzy processor uses linguistic rules to determine what control action should occur in response to a given set of input values
- Rule evaluation also referred as fuzzy inference, evaluates each rule with the inputs that were generated from the fuzzification process.

Syntax of rules

- IF *antecedent 1* AND *antecedent 2* AND THEN *Consequent 1* AND

A two Input, two rule Mamdani FIS with a fuzzy input

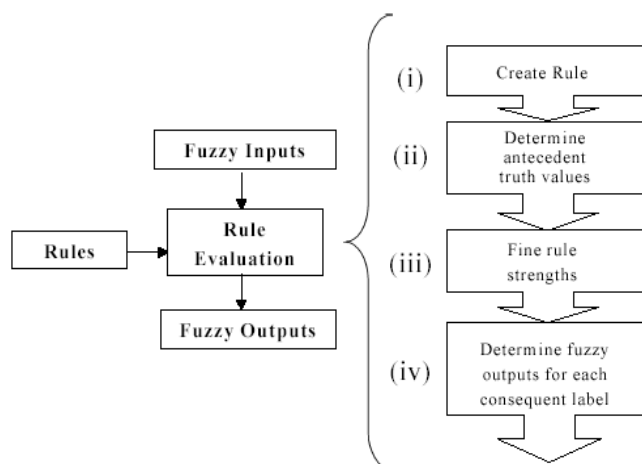

Example Case 1
OUTPUT MEMBERSHIP FUNCTION

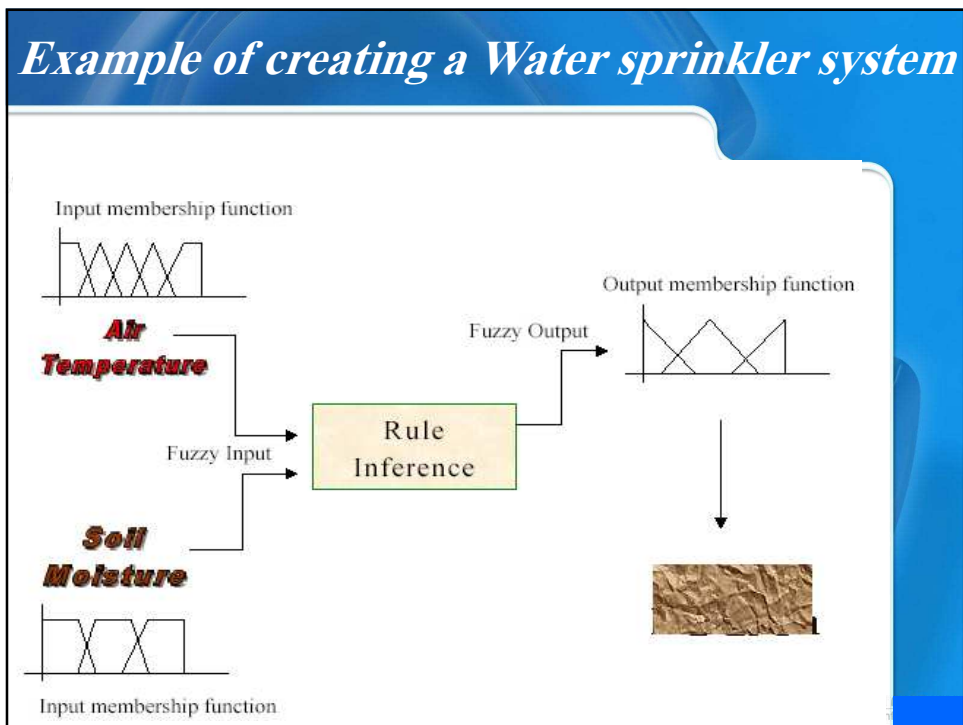

(iii) Find Rule Strength

- Rule 1: If **temperature is *hot*(0.3)** AND **soil is *dry*(0.7)**, then **water duration is *long***.
- Rule 2: If **temperature is *warm*(0.8)** AND **soil is *dry*(0.7)**, then **water duration is *long***.
- **To acquire the rule strength each rule, using MIN method to get the min.**
- **value of fuzzy inputs.**
- **For Rule 1, the rule strength = $\text{MIN}(0.3, 0.7) = 0.3$**
- **For Rule 2, the rule strength = $\text{MIN}(0.8, 0.7) = 0.7$**

Rule Evaluation/Interface (Step 2)

Rule Evaluation

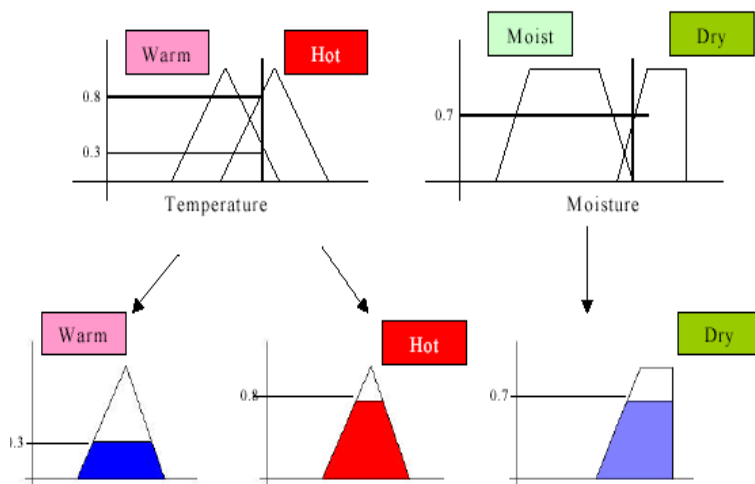

(i) Create Rule Base

		Antecedent 1				
		Temperature				
Antecedent 2		Cold	Cool	Normal	Warm	Hot
Moisture	Wet	short	short	short	short	short
	Moist	short	med.	med.	med.	med.
	Dry	long	long	long	long	long

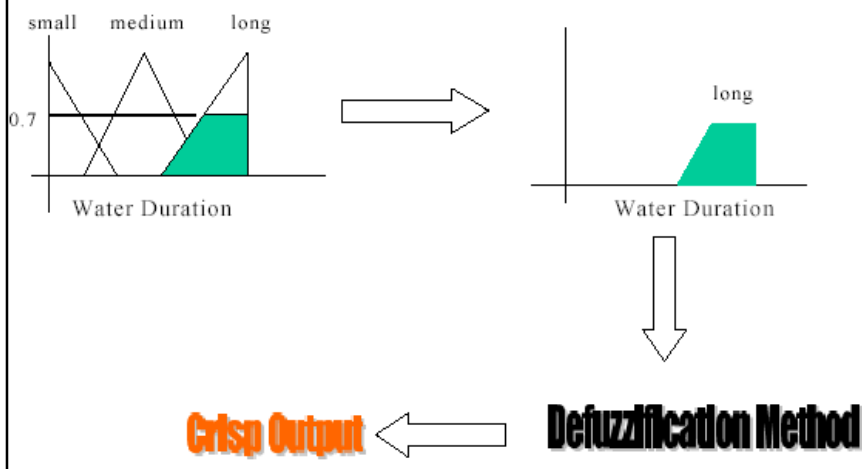

Sample rules extract from the table in above table

- If temperature is *hot* AND soil is *dry*, then water duration is *long*.
- If temperature is *cold* AND soil is *dry*, then water duration is *long*.

(ii) Determine antecedent truth values

Defuzzification

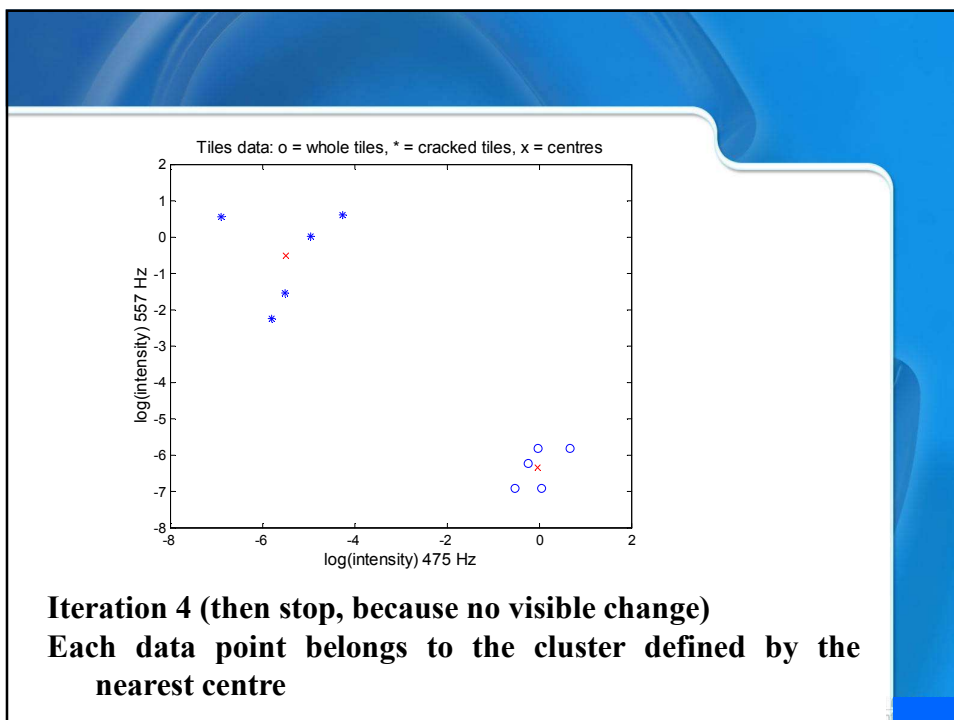

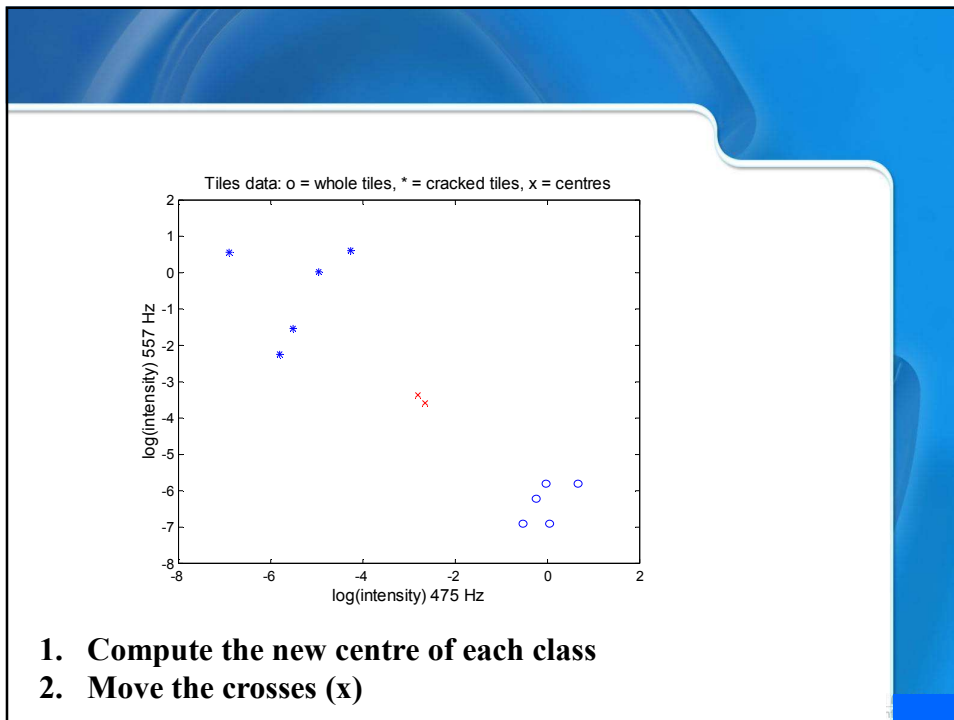

FUZZY IMAGE PROCESSING

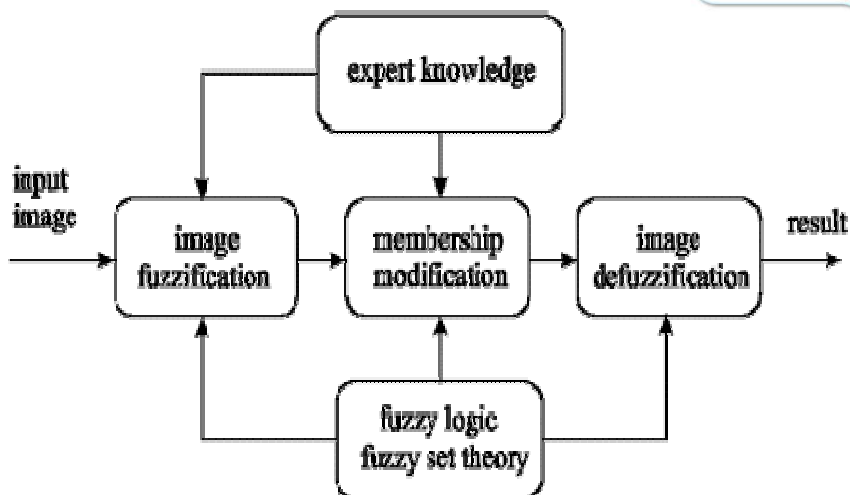

- ***Fuzzy Clustering***
- ***Line Pattern Matching***
- ***Optimal Image Thresholding***
- ***Fuzzy Rule-based Systems***
- ***Combined Classifiers***
- ***Fuzzy Contrast Adjustment***
- ***Fuzzy Image Segmentation***
- ***Fuzzy Edge Detection***

Fuzzy Clustering

- **C-Means Algorithm**
- **Fuzzy C-Means Algorithm**
- **Comparison between Hard and Fuzzy Clustering Algorithms**
- **Cluster Validity**
- **Applications**

The general structure of fuzzy image processing

Fuzzy Rule-Based Systems

- Learning from Examples
- Decision Tree Approach
- Fuzzy Aggregation Network Approach
- Minimization of Fuzzy Rules
- Defuzzification and Optimization

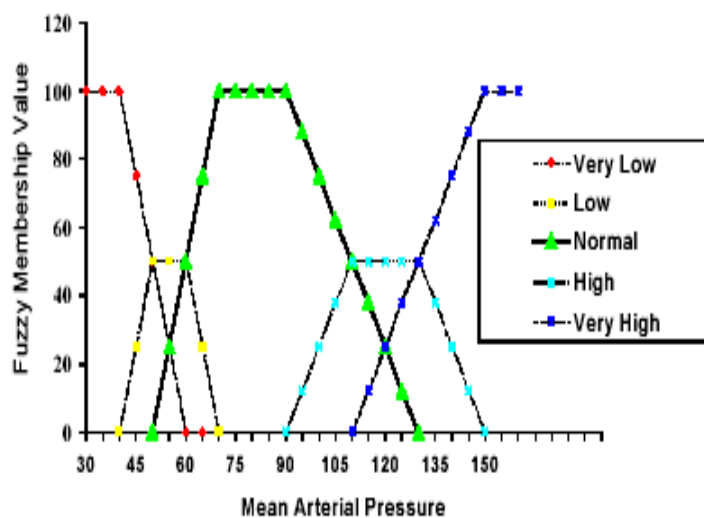

Fuzzy Logic in Medical Decision Making

- *The sugar level in the blood, for a normal human being, should be between 80-120mg per 100 ml. If it exceeds 120mg the person is said to be diabetic. But there are certain situations when the person may not be diabetic even if the sugar level in the blood exceeds 120mg. As examples, after a person exercises hard, the sugar level increases over 120mg, and for a pregnant woman, in her normal course of pregnancy, the sugar level in her blood may be more than 120mg. But in both these cases we cannot say that the patients are diabetic. Hence uncertainty arises, and fuzzy decision making can be applied here.*

Fuzzy Presentation of Medical Data

- mean arterial pressure (MAP)
 - systolic arterial pressure (SAP)
 - heart rate (HR)
- into mutually exclusive very low (VL), low (L), normal (N), high (H), and very high (VH) categories.

Fuzzy membership functions for MAP

Fuzzy Logic Control of Inspired Oxygen Concentration in Ventilated Newborn Infants

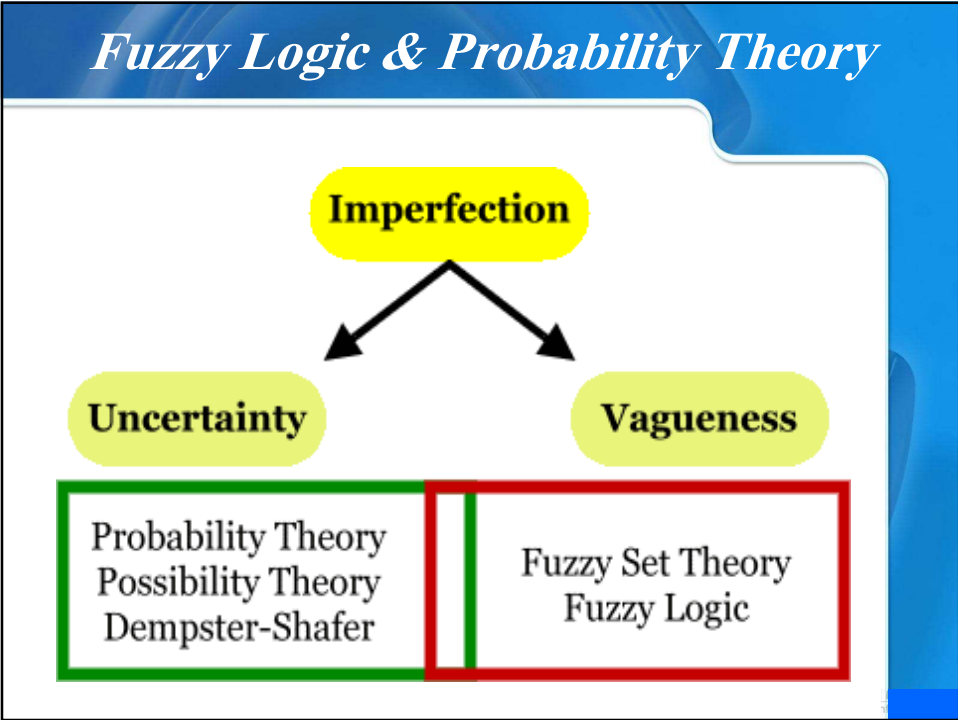

- **Rule: IF the $[\Delta]SaO_2$ is small-negative**
- **AND the SaO_2 -slope is medium-negative**
- **(situation)**
- **THEN increase the FIO_2 by a**
- **medium-positive amount.**
- **(action)**
- **Rule: IF the $[\Delta]SaO_2$ is large-negative**
- **AND the SaO_2 -slope is large-negative**
- **THEN increase the FIO_2 by an**
- **extremely-large-positive amount.**
- **Rule: IF the $[\Delta]SaO_2$ is small-negative**
- **AND the SaO_2 -slope is small-positive**
- **THEN do nothing.**

Line Pattern Matching

- **Similarity Measures between Line Segments**
- **Basic Matching Algorithm**
- **Dealing with Noisy Patterns**
- **Dealing with Rotated Patterns**
- **Applications**

Optimal Image Thresholding

- *Optimal Image Thresholding*
- **Threshold Selection Based on Statistical Decision Theory**
- **Non-fuzzy Thresholding Algorithms**
- **Fuzzy Thresholding Algorithm**
- **Formulation Thresholding Algorithms**
- **Multilevel Thresholding**
- **Applications**

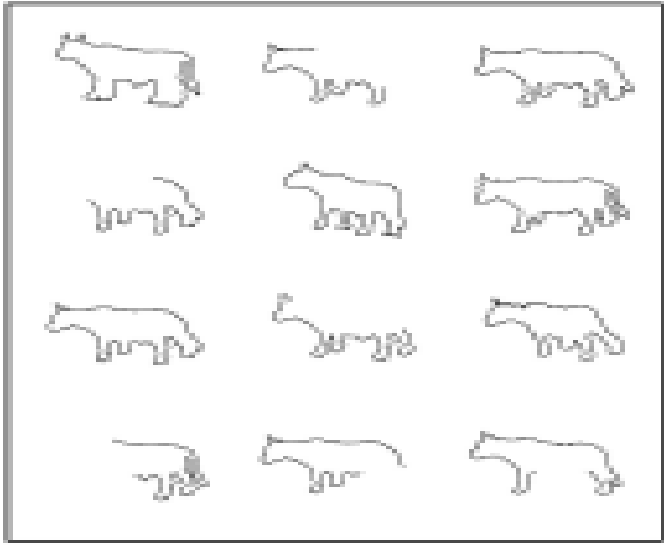

Face Recognition

A horizontal row of five grayscale photographs of a man's face, showing different perspectives: front-left, front, front-right, back-left, and back-right. The man has short, light-colored hair and is wearing a dark jacket over a white collared shirt.

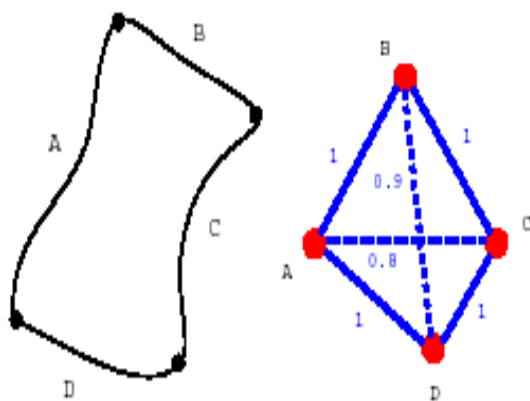

ANIMATION FACTORY
www.animationfactory.com

A 4x3 grid of 12 line-art drawings of a bear, illustrating various poses and movements. The drawings are arranged in four rows and three columns, showing the bear in different orientations and actions, such as walking, standing, and turning.

Fuzzy Relational Structures

SEGMENTATION OF VENTRICULAR ANGIOGRAPHIC IMAGES USING FUZZY CLUSTERING

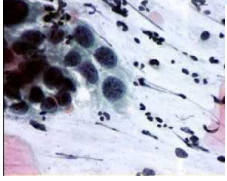

- (a) Original image after logarithmic subtraction and median filtering;
- (b) Fuzzy membership function of the ventricle region;
- (c) Segmentation obtained from the fuzzy membership function in (b) by using neighborhood processing.

Example: Classify cancer cells

Normal smear

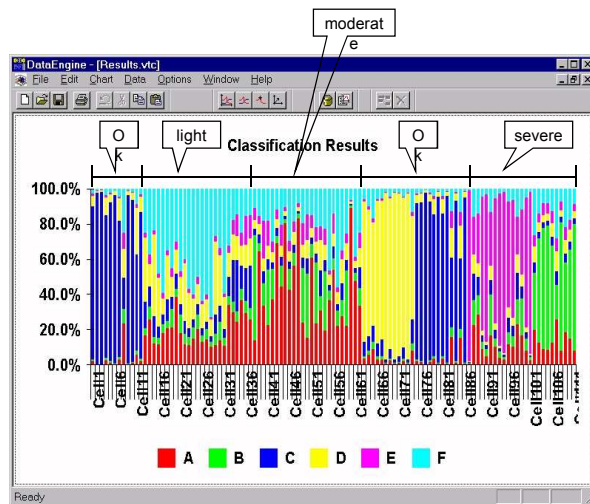

Severely dysplastic smear

Using a small brush, cotton stick, or wooden stick, a specimen is taken from the uterin cervix and smeared onto a thin, rectangular glass plate, a slide. The purpose of the smear screening is to diagnose pre-malignant cell changes before they progress to cancer. The smear is stained using the Papanicolau method, hence the name *Pap smear*. Different characteristics have different colours, easy to distinguish in a microscope. A cyto-technician performs the screening in a microscope. It is time consuming and prone to error, as each slide may contain up to 300.000 cells.

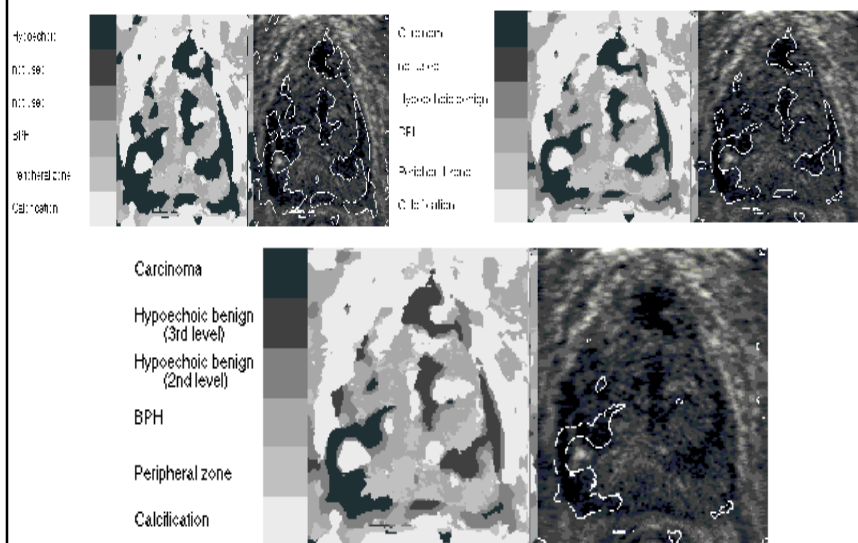

Dysplastic cells have undergone precancerous changes. They generally have longer and darker nuclei, and they have a tendency to cling together in large clusters. Mildly dysplastic cels have enlarged and bright nuclei. Moderately dysplastic cells have larger and darker nuclei. Severely dysplastic cells have large, dark, and often oddly shaped nuclei. The cytoplasm is dark, and it is relatively small.

Fuzzy Classifier (FCM)

A cell can belong to several classes to a Degree, i.e., one column may have several colours.

Prostate Tissue differentiation in Ultrasound Images

Fuzzy Segmentation of Magnetic Resonance Images

Figure 1: Application of FANTASM to MR image: (a) original image, (b) FCM gray matter membership, (c) FANTASM gray matter membership ($\beta = 100$), (d) FANTASM gray matter membership ($\beta = 250$)

Fuzzy Relative Position Between Objects in Image Processing

- fuzzy "landscape" around the reference object R as a fuzzy set
- compare the object A to the fuzzy landscape attached to R

Fuzzy Connectedness

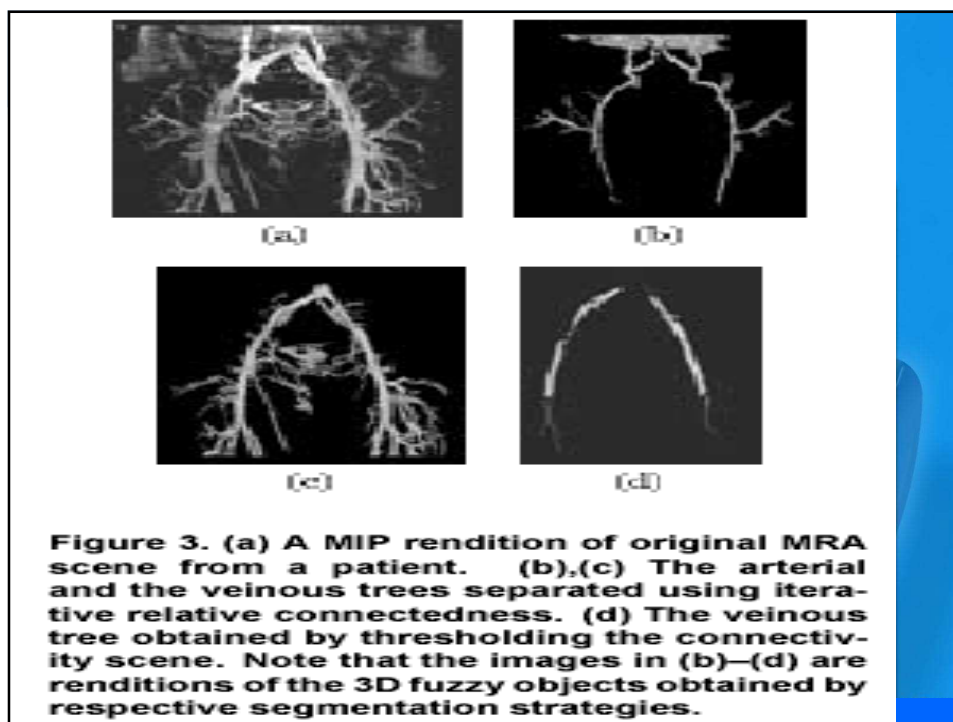

Figure 1. Illustration of the key ideas behind iterative relative fuzzy connectedness.

Relational region matching

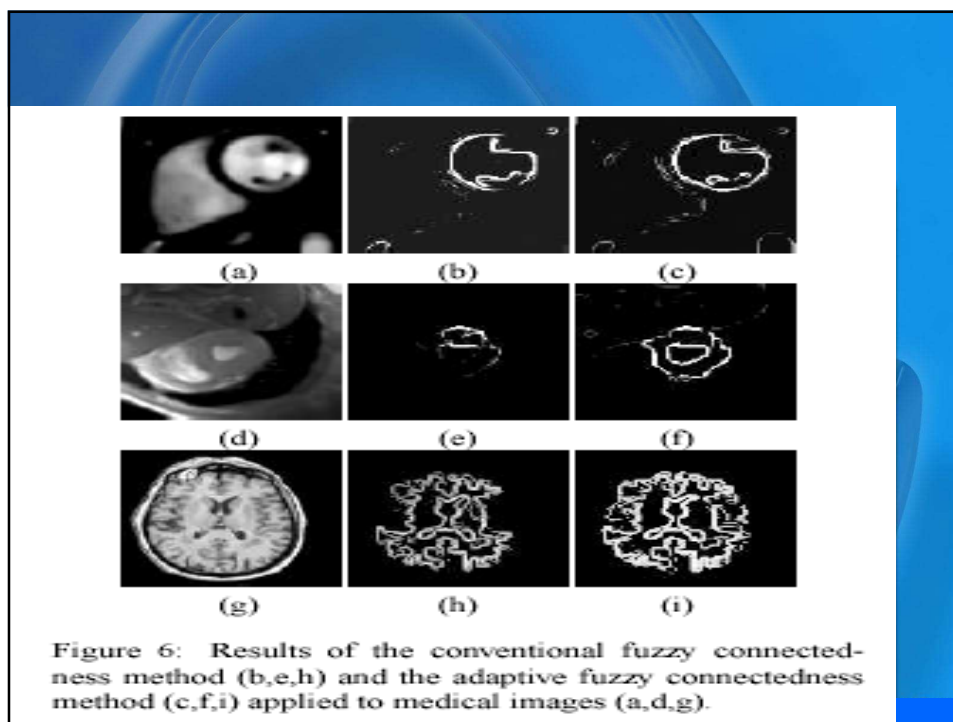

- **Image region attributes:** perimeter, area, shape, mean/max/min radius, centre of gravity, and amplitude, histogram, average gray values
- **attributes of the regions, or calculable inter-relationships between them**
- **compares similarities between weighted region property values in the reference and the target images in order to find the best match**

Combined Classifiers

- **Voting Schemes**
- **Maximum Posteriori Probability**
- **Multilayer Perceptron Approach**
- **Fuzzy Measures and Fuzzy Integrals**
- **Applications**

Medical Imagery Inexact Relational Matching

- *Matching/fusion strategies*
- *Inexact matching*
- *2D/3D medical imagery*
- *Rule-based knowledge representation*
- *Tree search*
- *Segmented into non-touching and non-overlapping regions,*
- *Image region attributes and their inter-relationships (relations) Region matches are obtained using a tree search*
- *Error is minimised by evaluating a "goodness of matching" Spline geometric transform*
- *Regional centers of gravity*

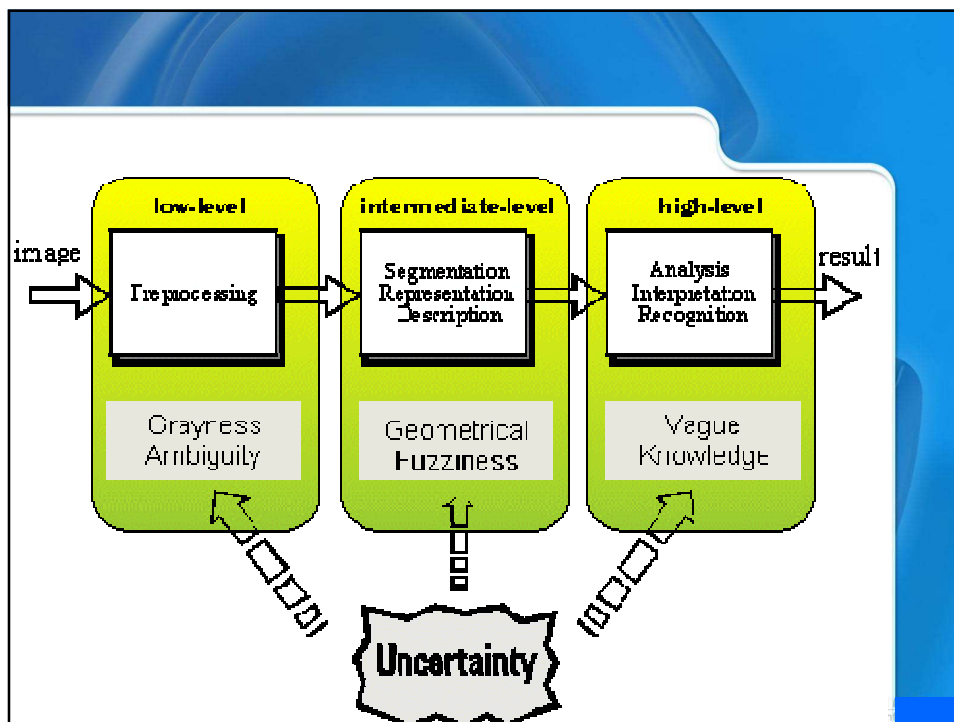

Reasoning with medical knowledge

- Expert or knowledge-based systems are the most common type of AIM system in routine clinical use
- Contain medical knowledge about a very specifically defined task (like allergy)
- Able to reason with data from individual patients to come up with reasoned conclusions
- Knowledge within an expert system is typically represented in the form of a set of rules.
- *Diagnostic assistance:* An expert system can help come up with likely diagnoses based on patient data.

MYCIN's Certainty Factors

- **Uncertainty formalism developed for the early expert**
- *measure of belief*: $MB(h; e) \in [0; 1]$
- *measure of disbelief*: $MD(h; e) \in [0; 1]$

Fuzzy Health in Medical Theory

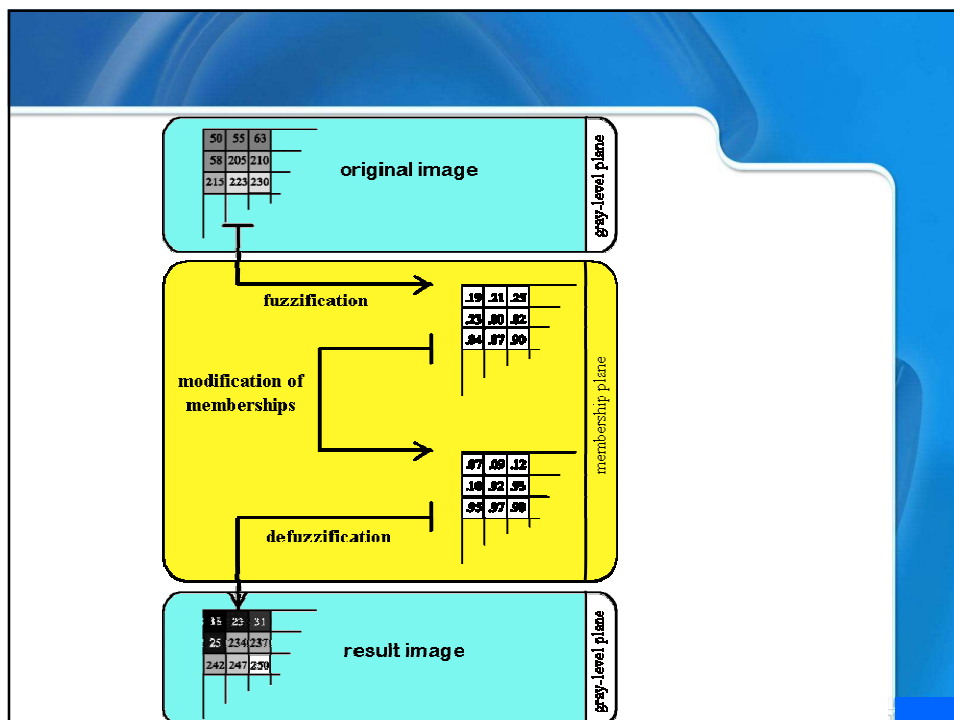

- **Sadegh-Zadeh's statements on the present state of the theory of medicine, in particular with regard to assumptions ascribed to contemporary theorists.**
- **Sadegh-Zadeh's interesting idea that a person can have a disease to varying degrees, from not having it at all to having it completely. I argue that there are difficulties pertaining to the definition of particular diseases, which obstruct the application of this idea.**
- **Medical semantics**
- **Principles for definition in general.**
- **Social definition of health, illness and disease**

Fuzzy Conceptual Graphs for Image Matching

- **fuzzy conceptual graphs that is suited to image matching and retrieval**
- **match images against a conceptual model, allowing for fuzziness in the concepts and relations**

Expert Systems for Image Processing and Analysis

- There are two kinds of knowledge-based systems for image understanding :
1. Expert Systems for Image Processing and Analysis (ESIPA) which deal with low-level processing up to segmentation .
 2. Image Understanding Systems (IUS) which have the symbolic description of an image as their goal .

Simulated MR phantom results

- (a) original image,
- (b) AFKM gray matter membership,
- (c) FCM gray matter membership,
- (d) true gray matter partial volume,
- (e) FCM maximum membership segmentation,
- (f) AFKM segmentation,
- (g) FANTASM segmentation,
- (h) true segmentation

Application of Fuzzy and Noise Tolerant Adaptive Segmentation Method (FANTASM) MR image

- (a) original image, (b) FCM gray matter membership,
- (c) FANTASM gray matter membership ($\beta = 100$), (d) FANTASM gray matter membership ($\beta = 250$)

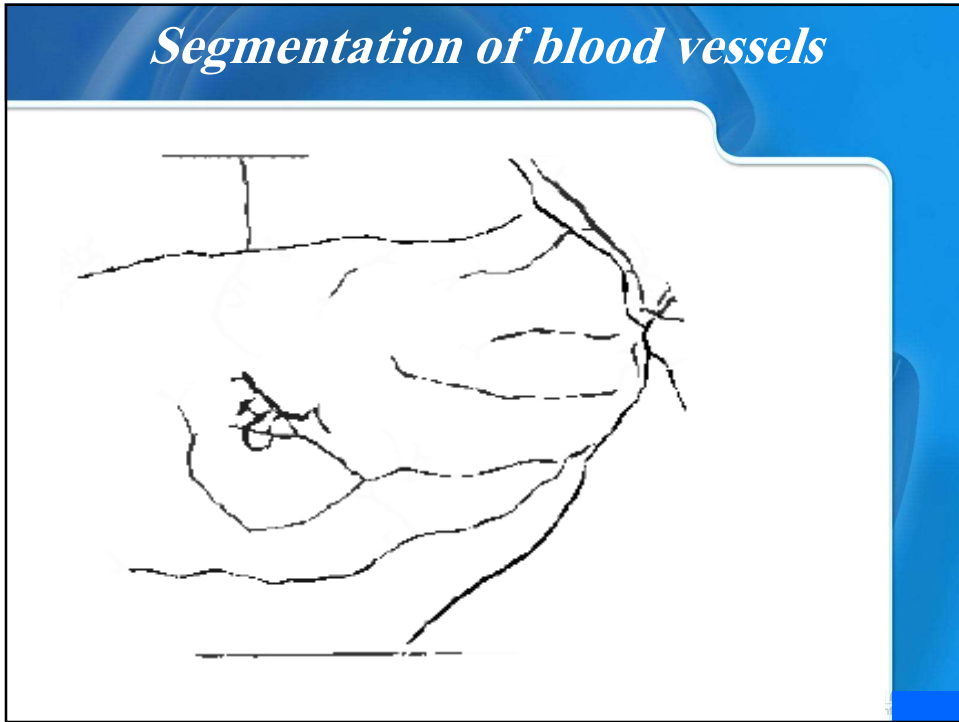

An ocular fundus image.

The nerve is obscured

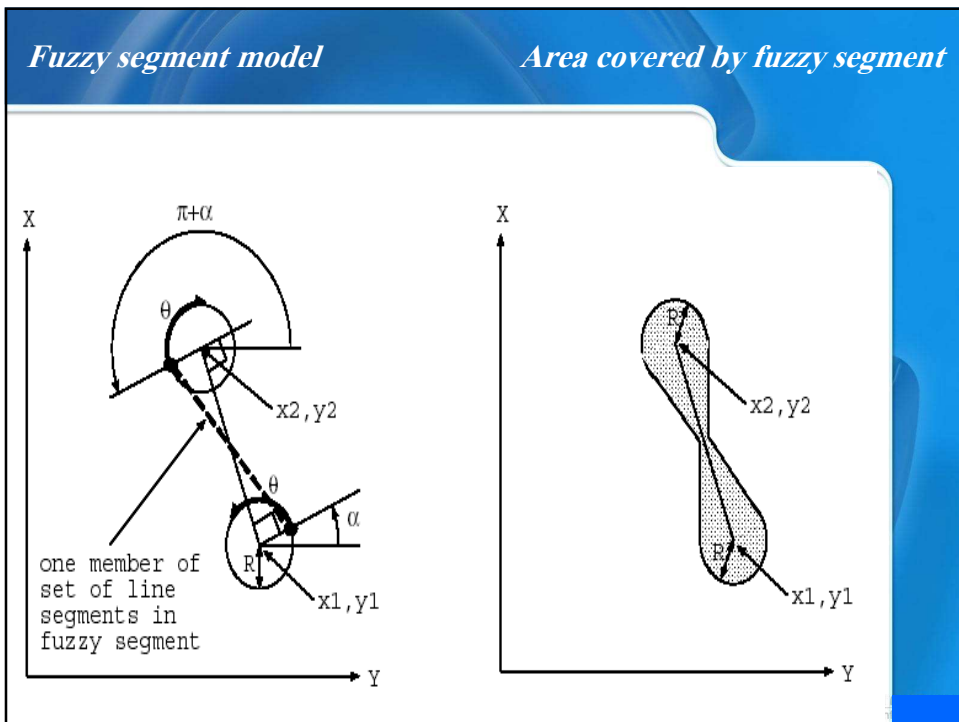

Segmentation of blood vessels

Fuzzy segment model

Area covered by fuzzy segment

*Blurred convergence image
with 'X' over strongest pixel*

*Fuzzy Connectedness-Based Medical Image
Segmentation*

- Fuzzy affinity maps of short-axis cardiac MRI (a) for which the weight for intensity energy function is (b) 1.0, (c) 0.75, (d) 0.50, and (e) 0.25, respectively.

Fuzzy Edge Detection

- Edge detection using a simple membership function

Edge detection using a rule-based approach

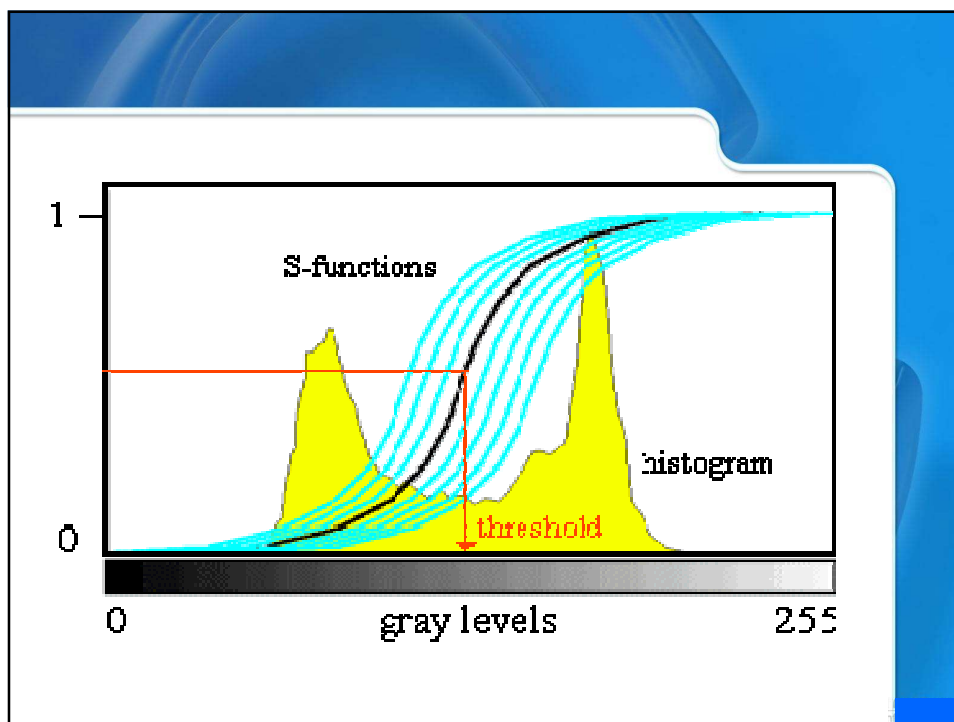

Fuzzy Edge Detection

Fuzzy Image Enhancement

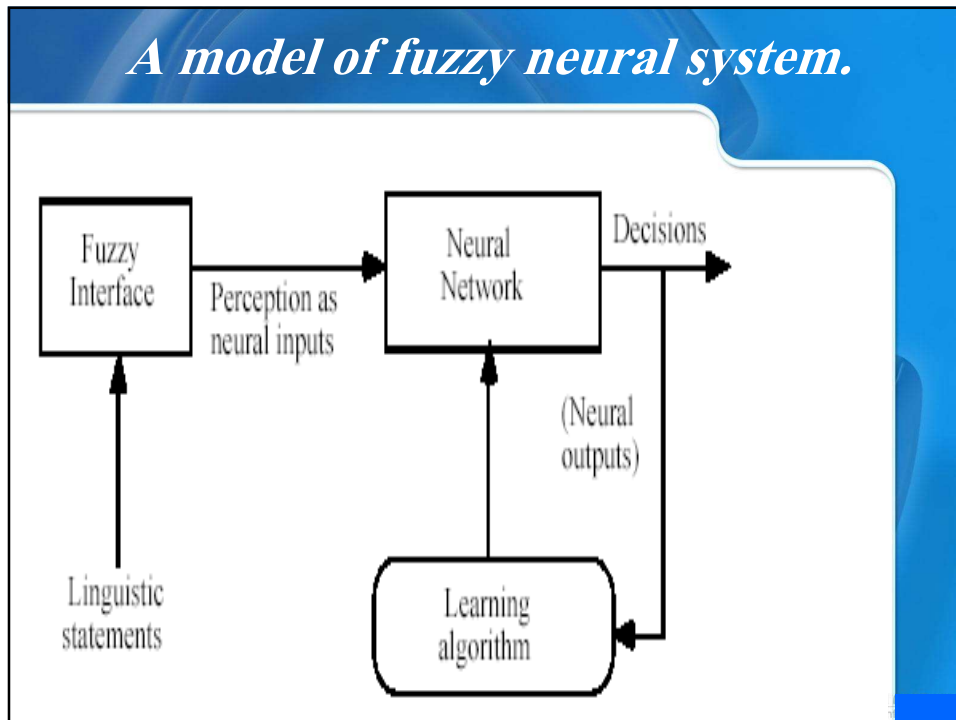

- Histogram fuzzification with three membership functions

Fuzzy Segmentation of Magnetic Resonance Images

- 1. Obtain initial estimates of the centroids
- 2. Compute membership functions
- 3. Compute gain field by solving the spatially varying difference equation for g_j :
- 4. Compute centroids
- 5. Go to step 2 and repeat until convergence.

A model of fuzzy neural system.
